

7 Signs Your Child Has Auditory or Visual Processing Problems

Solving the ADHD Riddle

Dr. Connie McReynolds

Most children with ADHD symptoms are unable to self-regulate, follow through, pay attention, or do what's asked of them. To understand what is causing these difficulties, it is necessary to understand the root cause of the problem.

The real cause is rooted in auditory and visual processing problems that affect a child's ability to concentrate, focus, remember, be organized, and follow through. Weak auditory and visual processing abilities interfere with a child's ability to understand and remember information, the core skills needed to function effectively in school and at home.

Here are 7 signs that your child may have auditory or visual processing problems affecting their ability to learn, succeed in school, and follow through on tasks.

- ___ Difficulty staying on task/easily distracted
- ___ Behavioral changes do not last despite warnings, punishments, or consequences
- ___ Tendency to "tune out" or "drift off" when listening
- ___ Difficulty with organizational skills/disorganized, messy room or backpack
- ___ Struggles to write legibly, messy handwriting
- ___ Has trouble remembering instructions, following rules or directions
- ___ Frequently loses or misplaces homework, personal items, etc.

As a licensed psychologist for more than 25 years, and with more than a decade of clinical results using neurofeedback, I have uncovered what I believe to be the *real* cause of ADHD and found effective solutions that do not involve stimulant medications.

More extensive questionnaires are included in my book available on [Amazon.com](https://www.amazon.com).
